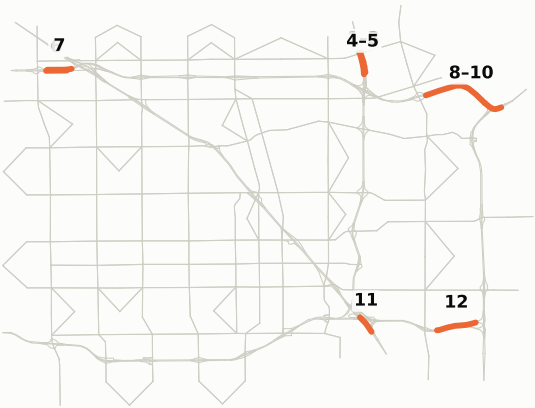
A

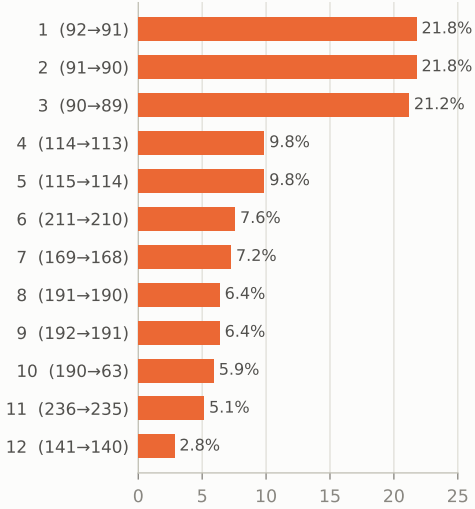
Where the 12 most critical links sit (orange)



B

Impact of closing each link (rank, from→to node)

		flow (veh/h)	v/c
1	(92→91)	8,510	1.18
2	(91→90)	8,510	1.18
3	(90→89)	7,777	1.08
4	(114→113)	7,859	1.09
5	(115→114)	7,859	1.09
6	(211→210)	7,892	1.10
7	(169→168)	7,955	1.10
8	(191→190)	7,623	1.06
9	(192→191)	7,623	1.06
10	(190→63)	6,999	0.97
11	(236→235)	8,936	0.99
12	(141→140)	8,494	1.18



Rise in total travel time when this link alone is closed
(% of baseline; 100% = 1.42 million veh·min per peak hour)

Single-link closures re-solved to equilibrium for the 60 links with the highest baseline flow (a screen, not exhaustive). Ranks 1–2 are adjacent segments of one arterial (equal effect); ranks 1–3 are consecutive links of one corridor. v/c = baseline volume-to-capacity ratio. Equilibrium noise is about 0.05% of baseline.
