

Closing one link at a time and re-solving to equilibrium, for the 60 links with the highest baseline flow (a screen, not exhaustive). Both directions of a road share one geometry, so ranks 1 to 5 sit on one corridor (as do ranks 6 and 7, and 8 to 10). Ranks 1 and 2 are adjacent segments of one arterial and have identical effect. Zone-centroid connectors are not drawn. 100% = 1.42 million vehicle-minutes per peak hour. Solver noise is about 0.05%.
