
Anaheim network (914 links, 38 zones). Every ratio is paired with a baseline solved the same way (solver noise about 0.05%). Lines through points: S2 to S5, range across BPR parameters (alpha 0.15 to 0.50, beta 3 to 5), with an arrow where the range runs off the axis; S1, 95% bootstrap interval of the median. Total travel time falls when demand goes unserved and rises when demand grows, so panel B is the like-for-like measure. The S1 run closing a single link (ratio 1.00) is omitted.
