
Panels A and B: Frank-Wolfe solver gap ε swept from 1e-2 to 1e-5; errors are relative to the ε = 1e-5 solution, and impact ratios are paired with a baseline solved at the same ε. Panel C: impact ratio at ε = 1e-4 against a single assignment iteration with no equilibrium, each paired with a baseline from the same method; the printed value is the single-iteration ratio relative to full equilibrium.
